

Golang #2

Concurrency

Vu Nguyen
vu.nguyen@will.vn

Why Go?

1. Single binary deployment
2. Minimal language
3. Easy concurrency
4. Full development environment
5. Multi-arch build
6. Low-level interface
7. ...

Why Go?

1. Single binary deployment
2. Minimal language
3. Easy concurrency
4. Full development environment
5. Multi-arch build
6. Low-level interface
7. ...

JavaScript

```
function *fibo() {  
    let a = 0, b = 1;  
    while (true) {  
        yield a;  
        [a, b] = [b, a+b];  
    }  
}
```

```
for (let value of fibo()) {  
    console.log(value);  
};
```

JavaScript

```
function *fibo() {  
  let a = 0, b = 1;  
  while (true) {  
    yield a;  
    [a, b] = [b, a+b];  
  }  
}
```

```
for (let value of fibo()) {  
  console.log(value);  
};
```

Single thread !

Golang

[Run](#)

```
func fibo(ch chan<- int) {  
    a, b := 0, 1  
    for true {  
        ch <- a  
        a, b = b, a + b  
    }  
}
```

```
func main() {  
    ch := make(chan int)  
    go fibo(ch)  
    for i:= 0; i < 10; i++ {  
        fi := <- ch  
        println(fi)  
    }  
}
```

Golang

[Run](#)

```
func fibo(ch chan<- int) {  
    a, b := 0, 1  
    for true {  
        ch <- a  
        a, b = b, a + b  
    }  
}
```

```
func main() {  
    ch := make(chan int)  
    go fibo(ch)  
    for i:= 0; i < 10; i++ {  
        fi := <- ch  
        println(fi)  
    }  
}
```

\$ export GOMAXPROCS=4

A vertical bar on the left side of the slide, composed of several colored rectangular segments: purple, blue, teal, green, orange, and red.

Golang #2

Concurrency

Concurrency in Go

1. What is `concurrency`?
2. Communicating with `channel` & `select`
3. Atomic accessing with `mutex.Lock()`
4. Detecting race condition with `go race`
5. Examples

A vertical bar on the left side of the slide, composed of several colored rectangular segments: purple, blue, teal, green, orange, and red.

What is concurrency?

What is concurrency?

Concurrency is the composition of independently executing computations.

Concurrency is a way to structure software, particularly as a way to write clean code that interacts well with the real world.

It is not parallelism.

Concurrent = Two Queues One Coffee Machine

Parallel = Two Queues Two Coffee Machines

Parallelism

Concurrency
(without parallelism)

A vertical bar on the left side of the slide, composed of several colored rectangular segments: purple, blue, teal, green, orange, and red.

Goroutine

Goroutine

It's an independently executing function, launched by a `go` statement.

It has its own call stack, which grows and shrinks as required.

It's very cheap. It's practical to have thousands, even hundreds of thousands of goroutines.

It's not a thread.

Example: Hello

[Run](#)

```
func hello(name string) {  
    for {  
        fmt.Println("Hello from", name)  
        time.Sleep(200 * time.Millisecond)  
    }  
}
```

```
func main() {  
    go hello("Alice")  
    go hello("Bob")  
    time.Sleep(1000 * time.Millisecond)  
}
```

Communication

channel & select

Channel

- `c := make(chan int)` – Makes an unbuffered channel of ints
- `c <- x` – Sends a value on the channel
- `<- c` – Waits to receive a value on the channel
- `x = <- c` – Waits to receive a value and stores it in x
- `x, ok = <- c` – ok will be false if channel is closed
- `close(c)` – Mark a channel not available to use

Example: Hello channel

[Run](#)

```
func hello(name string) chan string {  
    c := make(chan string)  
    go func() {  
        for {  
            c <- "Hello from " + name  
            time.Sleep(100 * time.Millisecond)  
        }  
    }()  
    return c  
}
```

```
func main() {  
    a := hello("Alice")  
    b := hello("Bob")  
    for i := 0; i < 5; i++ {  
        fmt.Println(<-a)  
        fmt.Println(<-b)  
    }  
}
```

Example: Multi-flexing

[Run](#)

```
func fanIn(c1, c2 <-chan string) <-chan string {  
    c := make(chan string)  
    go func(){ for { c <- <-c1 } }()  
    go func(){ for { c <- <-c2 } }()  
    return c  
}
```

```
func main() {  
    c := fanIn(hello("Alice"), hello("Bob"))  
    for i:= 0; i < 10; i++ {  
        fmt.Println(<-c)  
    }  
}
```

Example: Fibonacci

[Run](#)

```
func fibo(ch chan<- int) {  
    a, b := 0, 1  
    for true {  
        ch <- a  
        a, b = b, a + b  
    }  
}
```

```
func main() {  
    ch := make(chan int)  
    go fibo(ch)  
    for i:= 0; i < 10; i++ {  
        fi := <- ch  
        println(fi)  
    }  
}
```

Example: Unique ID service

[Run](#)

```
func startIdService() chan int {  
    c := make(chan int)  
    counter := 0  
    go func() {  
        for {  
            counter++  
            c <- counter  
        }  
    }()  
    return c  
}
```

```
func main() {  
    c := startIdService()  
    id1 := <- c  
    id2 := <- c  
    fmt.Println(id1, id2)  
}
```

Select

```
select {      // Try executing each statement until one is available
  case <- c1:      // Try reading from c1
  case x := <- c2  // Try reading from c2 to x
  case c3 <- value // Try sending to c3
  default:        // Run if no other statement available
}
```

Example: Hello channel & select

[Run](#)

```
func hello(name string) chan string {  
    c := make(chan string)  
    go func() {  
        for i := 0; i < 5; i++ {  
            c <- "Hello from " + name  
            time.Sleep(100 * time.Millisecond)  
        }  
    }()  
    return c  
}
```

```
func main() {  
    a := hello("Alice")  
    b := hello("Bob")  
    for {  
        select {  
        case v, ok := <-a:  
            if !ok {  
                return  
            }  
            fmt.Println(v)  
        }  
    }  
}
```

Example: First response

```
func get(c chan string, url string) {
    if res, err := http.Get(url); err == nil {
        data, _ := ioutil.ReadAll(res.Body)
        c <- string(data)
    }
}

func main() {
    first := make(chan string)
    for _, url := range []string{ "http://example.com", "http://google.com" } {
        go get(first, url)
    }
    body := <- first
}
```

Example: Timeout

[Run](#)

```
func timeout(t time.Duration) <-chan int {  
    c := make(chan int)  
    go func() {  
        time.Sleep(t)  
        close(c)  
    }()  
    return c  
}
```

```
func main() {  
    chTime := timeout(time.Second)  
    chBody := make(chan string)  
    go get("http://example.com")  
    select {  
        case body := <-chBody  
            fmt.Println(body)  
        case <-chTime:  
            fmt.Println("Timeout!")  
    }  
}
```

Atomic access

`mutex.Lock()`

mutex.Lock()

```
var m sync.Mutex // Make a new mutex
```

```
m.Lock()
```

```
m.Unlock()
```

// Code between Lock() and Unlock() can only be executed in one goroutine at the same time.

Example: Lock() - 1

[Run](#)

```
var a = make([]int, 0)

func add(i int) {
    time.Sleep(time.Duration(rand.Intn(100)) * time.Millisecond)
    a = append(a, i)
}

func main() {
    for i := 0; i < 10; i++ {
        go add(i)
    }
    time.Sleep(time.Second)
    fmt.Println(a)
}
```

Example: Lock() - 2

[Run](#)

```
var a = make([]int, 0)
var m sync.Mutex

func add(i int) {
    m.Lock()
    defer m.Unlock()

    time.Sleep(time.Duration(rand.Intn(100)) * time.Millisecond)
    a = append(a, i)
}
```

Example: Wait Group

```
var wg sync.WaitGroup
var urls = []string{ "http://www.golang.org/", "http://www.google.com/" }
for _, url := range urls {
    wg.Add(1)
    go func(url string) {
        defer wg.Done()
        http.Get(url)
    }(url)
}

wg.Wait()
```

A vertical bar on the left side of the slide, composed of several colored rectangular segments: purple, blue, teal, green, orange, and red.

Detecting race condition

go race

Detecting race condition

```
go run -race sample.go
```

```
go test -race sample
```

```
go build -race sample
```

```
go get -race sample
```

Sample output

```
$ go run -race examples/race.go
```

```
=====
```

```
WARNING: DATA RACE
```

```
Read by goroutine 10:
```

```
    main.add()
```

```
        /home/i/x/src/go2/examples/race.go:18 +0x5a
```

```
Previous write by goroutine 14:
```

```
    main.add()
```

```
        /home/i/x/src/go2/examples/race.go:18 +0x12a
```

Rules

Rules

- Use `channel` to synchronize between goroutine
- Only one goroutine can read and write a variable
 - + Or use `mutex.Lock()`
- `close(c)`: Use like sending an EOF value. Only sending goroutine should call `close()`

Golang #2: Concurrency

Thanks for your listening
